STACBOND

Fire Retardant Aluminum Composite Material

STACBOND® is a composite panel made of two aluminum sheets and a mineral core, designed to meet the most stringent fire-resistance classification standards. With exceptional mechanical properties—high rigidity, excellent flatness, impact resistance, durability, and easy maintenance—it is the ideal cladding solution for tall and high-occupancy buildings.

The panel features an external layer of 5005 aluminum alloy and an internal layer of 3005/3105 aluminum alloy, coated with premium-quality paint for superior aging resistance. STACBOND® offers a full range of colors, finishes, and textures, including custom RAL, PANTONE, or NCS colors upon request.

Manufactured through a meticulously controlled process with rigorous testing and quality assurance, STACBOND composite panels guarantee outstanding performance, durability, and compliance with safety standards.
